Subject: Limited Phase II Subsurface Investigation
Carlos Street at Sierra Street
Moss Beach, San Mateo County, California 94038
AEI Project No. 350428

Dear Ms. Liu:

AEI Consultants (AEI) is pleased to provide this report which presents the results of the Limited Phase II Subsurface Investigation (Phase II) performed at the above referenced subject property. This investigation was completed in general accordance with the authorized scope of services outlined in our proposal dated November 19, 2015 (AEI Proposal No. 44236), as well as in accordance with the findings presented in AEI's DRAFT Phase I Environmental Site Assessment Report dated November 10, 2015. The location of the subject property is shown on Figure 1.

The purpose of this investigation is to assess whether or not subsurface conditions (i.e., soil) beneath the property have been impacted by the historical onsite operations. Information regarding the site description, background, scope of work, findings, conclusions, and recommendations for this investigation is provided in the following sections of this report.

1.0 SITE DESCRIPTION

The subject property comprises approximately 10.4 acres of vacant land, located to the north-northeast of the intersection between Carlos Street and Sierra Street in Moss Beach, an unincorporated community within San Mateo County, California. As shown on Figure 2, the property is bounded by residential properties along 16th Street (in Montara), and vacant land to the north, residential properties along Carlos, Sierra, and Stetson Streets to the south, residential properties along Lincoln and Buena Vista Street to the east, and one residential property and vacant land along Carlos Street to the west. Numerous concrete slab-on-grade building foundations, along with foundation retaining walls having scattered areas of graffiti, are present within the western and southwestern portions of the property. In some areas, these foundations are covered by thick vegetation consisting of trees and shrubs. Heavy vegetation also covers the majority of the property outside the areas of the building foundations. Unpaved roadways extend northwest-southeast across the north and central portions of the property. As shown on an Old Republic Title Company Preliminary Title Report Map dated October 8, 2015,

easements for Montara Water and Sanitary District (MWSD) and Pacific Gas and Electric (PG&E) utilities extend along the unpaved roadways within the property. MWSD infrastructure consisting of water storage tanks, a booster pumping system, and distribution facilities are located within a small, fenced-in parcel of land (known as Schoolhouse) adjacent to and west of the intersection of Lincoln Street and Buena Vista Street near the eastern boundary of the property. Another MWSD easement also extends southward from this parcel to Sierra Street, as shown on the Preliminary Title Report Map.

Topographically, the property generally slopes to the west-southwest with the exception of a steeply inclined, north-facing slope along the northern property boundary. Localized, relatively flat areas or topographic benches are present near the west and southwest boundaries of the property, as well as adjacent to Lincoln Street along the northeast corner of the property. Surface elevations at the property generally range between approximately 100 and 200 feet above mean sea level. The closest surface water body includes an unnamed, east-west trending, ephemeral drainage which parallels 16th Street to the north of the property.

Based on our review of a United States Geological Survey (USGS) Open File Report 98-137 Map entitled *Geology of the Onshore Part of San Mateo County, California* (Brabb, et.al., 1998), the subject property is situated upon a marine terrace underlain by Quaternary-aged alluvial deposits, along with thin, scattered veneers of residual soils. These units are further underlain by Montara Mountain granitic bedrock of Cenozoic age. Artificial fill consisting of soils, construction debris, wood debris, and other miscellaneous materials were scattered along the ground surface across the property.

The current estimated depth to groundwater beneath the property is unknown; however, well yield report information associated with a water supply well installed on the property in 1986 showed a static water level of 168 feet below ground surface (bgs). Based on the local site topography, the direction of groundwater flow is inferred to generally flow to the west-southwest, but also is inferred to flow to the north into the drainage adjacent to 16th Street.

2.0 BACKGROUND

As described in AEI's Phase I ESA report, historical sources indicated that the subject property was part of a large World War II training area circa 1945. Numerous military buildings had been present on the subject property, as shown on a drawing entitled *Map of Anti-Aircraft Training Center, Point Montara, California, Twelfth Naval District, Showing Conditions on June 30, 1945*, which was presented in Appendix F of AEI's Phase I ESA report. These buildings included barracks, offices, a mess hall, a library, a garage, a boiler room, an incinerator, a "TDD hanger", and a "drill field". After the war was over, the mess hall building was converted into a grammar school, and was later abandoned after a new school site was built (date unknown). By the late 1960s, the property was used as a training ground for firefighters. During firefighter training, AEI assumed that accelerants, such as those containing gasoline, may have been used along concrete pad surfaces. Burned materials from the firefighter training may have been washed off the pads and into unpaved, surrounding areas. Between approximately 1968 and 1970, a controlled burn occurred, which resulted in the burning of the several remaining buildings, leaving only exposed concrete foundations. Since at least 1970, the property has been vacant with the exception of the scattered, older building foundations, as well as the

fenced area containing MWSD infrastructure to support current water storage and distribution operations.

Recognized environmental conditions (RECs) were identified during AEI's Phase I ESA. These included the potential presence of lead-based paint in soils surrounding the building foundations, the "drill field", which may have been used for weaponry or as a shooting range, concrete pad areas potentially used for firefighter training, and an incinerator. In addition, during the planning stages of this Phase II, a boiler room was noted and identified as a REC to be further investigated. Other environmental considerations included two (2) domestic water supply wells that were reportedly no longer in use. Prior to this investigation, the locations of these wells were unknown. It was also unknown if the wells were properly abandoned in accordance with local County regulations.

3.0 INVESTIGATION EFFORTS

The scope of work for this investigation focused on assessing the presence or absence of impacted subsurface conditions (i.e., soil) relative to the former historical operations. AEI's investigation efforts included a site reconnaissance and utility clearance to locate the water supply wells and to check for the presence of underground utilities around planned drilling locations, a drilling/soil sampling program, and laboratory analyses.

3.1 Pre-Field Activities

3.1.1 Health and Safety Plan

A site-specific health and safety plan was prepared, reviewed by onsite personnel, and kept onsite for the duration of the fieldwork.

3.1.2 Permitting and Utility Clearance

Based on the scope of work including only shallow soil sample collection, no drilling permit was required from San Mateo County Environmental Health Services (SMCEHS) for this investigation.

On December 17, 2015, the property was reconnoitered by AEI to attempt to locate the former water supply wells. In addition, planned boring locations were staked and marked with white paint. Upon marking the boring locations, Underground Services Alert (USA) North was contacted, who, in turn, notified subscribing utility companies in order for their underground utility locations to be marked along property boundaries and around planned boring locations.

On December 21, 2015, a limited geophysical survey and utility clearance was performed by Foresite Engineering Surveys (Foresite) of Pleasant Hill, California under subcontract to AEI. The geophysical survey was performed to support site reconnaissance efforts in locating the water supply wells. The utility clearance was performed to check for the presence of underground utilities around planned boring locations and to shift boring locations, as appropriate.

3.1.3 Review of Water Supply Well Information

During December 2015 and January 2016, SMCEHS was contacted on numerous occasions to gather more information about the former water supply wells at the subject property. To date, no

information regarding these wells has been provided by SMCEHS other than the information provided during AEI's Phase I ESA. However, one (1) of the wells appears to have been located during the investigation, as further discussed in Section 4.1.

3.2 Field Activities

3.2.1 Exploratory Borings

The drilling program for this investigation was conducted on December 22 and 23, 2015. Thirty-three exploratory borings (B-1 and B-3 through B-34) were advanced to depths between 2.0 and 9.5 feet bgs. Of these total borings, twenty-seven (27) borings were advanced to the 2.0-foot depth for the collection of soil samples at the 0.0- and 1.5-foot depths. These locations included Boring B-1, which was advanced around the former incinerator area, and Borings B-4 through B-11, B-14, B-16, and B-18 through B-34, which were advanced to the 2.0-foot depth around former concrete foundation areas and "drill field" area. The other five (5) borings were advanced to depths between 5.5 and 9.5 feet bgs with soil samples for laboratory analyses obtained at depths between 2.0 and 7.0 feet bgs. These locations included Boring B-3, which was advanced along the west side of the concrete foundation for the former boiler room, and Borings B-12, B-13, B-15, and B-17, which were advanced to the 9.5-foot depth around the former locations of concrete pads suspected of using accelerants during firefighter training. Four attempts were made to advance Boring B-2; however, this location was abandoned due to drilling refusal encountered just below the ground surface at each attempted location. The locations of these borings are shown on Figure 3.

The borings were drilled by a State of California C-57 licensed company, Environmental Control Associates, Inc. (ECA) of Aptos, California, under subcontract to AEI. Because of difficult, heavily-vegetated, soft terrain caused by recent rainy weather, the borings were advanced with a track-mounted drilling rig equipped with direct push technology. Upon completion of drilling, the borings were backfilled with soil cuttings generated during the drilling program.

The borings were continuously sampled throughout their entire depths for the purposes of lithologic logging, field screening (headspace testing), and selection of samples for laboratory analyses. Soil samples were obtained using a single-walled coring system approximately 2.25 inches in diameter and 4 feet in length containing plastic liners. The coring system was connected to 1-inch diameter, flush-jointed drill rod that was hydraulically driven (pushed) by the rig to each target sample depth. Upon retrieval from each sample depth interval, the coring system was opened, and the liners were removed and cut for preparing samples for laboratory analyses, as well as for visual inspection and lithologic logging purposes. Recovered soil samples were examined for soil classification and described on detailed boring logs in general conformance with the Unified Soil Classification System (USCS). Headspace tests were performed with a photo-ionization detector (PID) used for detecting the presence of volatile organic compounds (VOCs) in the soil samples. Headspace tests only were conducted in soil samples obtained from Borings B-3, B-12, B-13, B-15, and B-17, which were advanced around the former locations of concrete pads used for firefighter training and the former boiler room. The boring logs are presented in Appendix A.

Soil samples selected for laboratory analyses were sealed, labeled, and entered onto chain of custody documentation for transportation to a California state-certified laboratory for analyses.

Upon collection, the ends of the plastic tubes were covered with Teflon tape and capped. The samples were labeled with the project name, project number, boring number, sample depth, and sampling date/time of sampling. After labeling, the samples were placed into a chilled ice chest for transport to the analytical laboratory.

3.3.2 Headspace Testing

Headspace testing was performed during drilling activities with a photo-ionization detector (PID) for detecting the presence of VOCs in recovered soil samples. Headspace testing was generally performed at every 2-foot interval of the recovered sample cores from Borings B-3, B-12, B-13, B-15, and B-17. To initiate the headspace testing procedure, soil samples were removed from the liners, placed into labeled, plastic bags, and sealed for conducting the tests. After sufficient time elapsed for vapor build-up inside the bags, the bags were punctured with the probe tip of the PID to allow for measurement of the headspace. Measurements of the headspace were obtained in the parts per million (ppm) range for total VOCs. During this investigation, none of the headspace test measurements exceeded ambient air background concentrations, which were generally measured at 0.0 ppm.

3.3.3 Decontamination and Investigation-Derived Wastes

Drilling and sampling equipment were cleaned prior to and after drilling each boring. The equipment also was cleaned between core intervals using a triple rinse method. The initial rinse consisted of an Alconox and water solution, followed by two (2) tap water rinses (second and final rinses). No investigation-derived wastes were generated during this investigation.

3.4 Laboratory Analyses

Soil samples were submitted McCampbell Analytical, Inc. of Pittsburg, California for laboratory analyses. Additional samples also were submitted to the analytical laboratory and initially placed on hold. Additional laboratory analyses for lead were run on soil samples obtained from the 1.5-foot depth at Borings B-7, B-20, and B-21 on the basis of the initial analytical results.

The types and numbers of soil analyses included the following:

- Lead by United States Environmental Protection Agency (EPA) Method 6010.....27 samples
- Volatile Organic Compounds (VOCs) by EPA Method 8260B.....5 samples
- Total Petroleum Hydrocarbons as gasoline (TPH-g) by EPA Method 8015M.....5 samples
- TPH as diesel (TPH-d) and motor oil (TPH-mo) by EPA Method 8015M.....2 samples
- Polychlorinated Biphenyls (PCBs) by EPA Method SW8082 1 sample
- Dioxans and Furans by EPA Method 1613 1 sample
- California Assessment Manual (CAM) 17 Metals by EPA Method 6010..... 1 sample

The samples were analyzed over a standard turnaround time (TAT) except for the additional soil samples, which were analyzed over a 1-day TAT. Chain-of-custody documentation and certified analytical reports are provided in Appendix B.

4.0 FINDINGS

4.1 Water Supply Wells

During AEI's Phase I ESA, it was found that two (2) former domestic water supply wells were located on the property. To gather more information about these wells, AEI attempted to contact SMCEHS; however, no additional information regarding these wells has been provided to date.

Based upon our review of preliminary information appended to AEI's Phase I ESA report, it was noted that at least one (1) domestic well permit (Permit No. W-43-86) was issued to California School Employee Association by San Mateo County Department of Public Health & Welfare on May 28, 1986. On June 18, 1986, a well yield test was performed, which included the well depth, standing and static water levels, and time versus drawdown testing over an approximate 5-hour period of time. As shown on a Well Yield Report Information form dated June 19, 1986, the owner was identified as Farrallon Vista Association under Permit No. DRW #149554. The total depth of the well is 400 feet. Static and standing water levels were measured at depths of 168 and 35 feet bgs, respectively. No information was provided regarding the well construction details other than the recorded well depth. On July 9, 1986, water quality testing for bacteriology and chemistry purposes had been performed at this well. As described under some telephone notes dated December 19, 1990, shown on a County Septic and Well Check-Off List, it was stated that the two (2) wells were installed under one permit and that both wells "would be repaired so that the aquifers were adequately protected." In addition, on this same Check-Off List, it was stated that the "upper well has been sealed by welded steel; lower well has been sealed flush with pad with bolted steel plate."

On the basis of the information provided to date, it appears that information for only one (1) well and its approximate location, instead of two (2) wells, was shown on the well construction application. The locations of the well shown on the application appeared to be the "upper well". No information on the location of the lower well was shown on the application.

During the site reconnaissance, it is believed that the location of the "upper well" was found. It is located upslope and to the east of Boring B-1, as shown on Figure 3. The surface completion for this well consists of a rectangular-shaped concrete pad which surrounds rusted, welded steel cover. The lower well was not located during the site reconnaissance. It is unknown if either of these wells were properly abandoned (i.e., backfilled with a new cement grout using tremie methods) in accordance with local regulations.

4.2 Subsurface Conditions

The results from the drilling program show that the subject property is underlain by alluvial and residual soils primarily consisting of sandy clays and clayey sands to the depths explored. No groundwater was encountered during drilling operation. No visual or olfactory evidence (i.e., soil discoloration, odor) of impacted soils was observed in any of the recovered soil cores during drilling operations. No PID readings above background levels above 0.0 ppm were measured during headspace testing.

4.3 Soil Analytical Results

Soil analytical results are presented on Table 1. Chain-of-custody documentation and certified analytical reports are provided in Appendix B.

Analytical results for soil obtained during this investigation are as follows:

- Lead was detected at concentrations between 4.5 and 230 milligrams per kilogram (mg/kg) in surface soils at each of the borings advanced around the concrete foundation and "drill field" areas.
- No TPH-g or VOCs were detected at concentrations at or above the laboratory reporting limits in any of the soil samples obtained from borings advanced around concrete pad areas used for firefighting purposes.
- TPH-d was detected at a concentration of 1.3 mg/kg at the 2.0-foot depth in Boring B-3, located around the former boiler room. No TPH-d was detected at a concentration at or above the laboratory reporting limit at the 5.0-foot depth in Boring B-3. No TPH-mo was detected at concentrations at or above the laboratory reporting limits in Boring B-3.
- Metals, including arsenic, barium, chromium, cobalt, copper, molybdenum, nickel, vanadium, and zinc, were detected at concentrations between 1.0 and 44 mg/kg at the 1.5-foot depth in Boring B-1, which is located around the former incinerator. No other metals were detected at concentrations at or above the laboratory reporting limits at that location.
- Total hexafurans were detected at a concentration of 2.78 picograms per gram (which is equivalent to 2.78×10^{-6} mg/kg) at the 1.5-foot depth in Boring B-1. No other dioxins/furans were detected at concentrations at or above the laboratory reporting limits.
- No PCBs were detected at concentrations at or above the laboratory reporting limits in any of the soil sample obtained from the one boring advanced around the area of the former incinerator.

For the purpose of providing context to the data obtained during this investigation, analytical results for soil were compared to established regulatory screening levels, including California Regional Water Quality Control Board (RWQCB), San Francisco Bay Region, Environmental Screening Levels (RWQCB ESLs) for residential land use for shallow soils (less than approximately 10 feet deep) assuming groundwater is a current or potential drinking water resource and USEPA Regional Screening Levels (RSLs) for resident soils. Of the chemical constituents analyzed, lead was found to exceed its RWQCB ESL within surface soils (0.0-foot depth) only at two (2) locations (Borings B-7 and B-21) adjacent to concrete foundation area. Subsequent analytical results for soils at the 1.5-foot depths at Borings B-7 and B-21 showed lead concentrations at one to two orders of magnitude below the RWQCB ESL. Arsenic was detected at a concentration slightly above its RWQCB ESL and USEPA RSL at the 1.5-foot depth in Boring B-1, located around the former incinerator area.

In summary, none of the detected chemical constituents in soil, including TPH-d and other metals, were found to exceed their respective RWQCB ESLs and USEPA RSLs. With respect to the low concentration of the total hexafurans, no regulatory screening levels are established for this constituent.

5.0 CONCLUSIONS AND RECOMMENDATIONS

AEI has completed a Phase II investigation at the subject property. The purpose of the Phase II at the subject property was to assess whether release(s) have occurred into the subsurface relative to the environmental concerns identified at the subject property. Thirty-three (33) exploratory soil borings were advanced the collection and analyses of soil samples during this investigation. Select samples were analyzed for one or more of the following: Lead, TPHs, VOCs, PCBs, CAM Metals, and Dioxins/Furans.

Detected concentrations of the various chemical constituents in soil were compared with their respective RWQCB ESLs and USEPA RSLs for those regulatory screening levels already established. None of the detected chemical constituents were found to exceed their respective RWQCB ESLs and USEPA RSLs except for lead detected within surface soils at two locations and arsenic detected at the 1.5-foot depth at one location. Additional laboratory analyses were run on soil samples obtained from the 1.5-foot depth to assess the vertical extent of lead-impacted soils at these two locations. Analytical results for the soil samples at the 1.5-foot depth showed lead concentrations below the RWQCB ESL and USEPA RSL. With respect to the presence of arsenic at the one location, its detected concentration is representative of naturally-occurring background conditions, which is within the range of arsenic concentrations found in soils within the San Francisco Bay Area (Bradford, et.al.).

Analytical results generated during this investigation suggest that the lead detected in soils may have originated from lead-based paint on former building exteriors. Furthermore, analytical results also suggest that lead concentrations, where elevated, are localized and appear to be restricted to surface soils at the two (2) identified locations. The vertical extent of lead-impacted soils at these two locations has been delineated on the basis of the lead concentrations not exceeding their RWQCB ESLs. The horizontal extent of lead-impacted soils at these two locations is undefined.

On the basis of the information, presented above, AEI recommends that a limited soil sampling program be performed to further assess the horizontal extent of lead-impacted surface soils around the two identified locations. AEI also recommends that the steel cover for the "upper well" be removed an experienced water well driller under subcontract to AEI to measure the well depth, as well as whether the well has been properly abandoned in accordance with County regulations.

7.0 REPORT LIMITATIONS AND RELIANCE

This report presents a summary of work completed by AEI Consultants. The completed work includes observations and descriptions of site conditions encountered. Where appropriate, it includes analytical results for samples taken during the course of the work. The number and location of samples are chosen to provide the requested information, subject to scope of work for which AEI was retained and limitations inherent in this type of work, but it cannot be assumed that they are representative of areas not sampled. This report should not be regarded as a guarantee that no further contamination beyond that which could have been detected within the scope of this investigation is present beneath the subject property. Undocumented, unauthorized releases of hazardous material, the remains of which are not readily identifiable by visual inspection and are of different chemical constituents, are difficult and often impossible to detect within the scope of a chemical specific investigation.

Any conclusions and/or recommendations are based on these analyses and observations, and the governing regulations. Conclusions beyond those stated and reported herein should not be inferred from this document. These services were performed in accordance with generally accepted practices, in the environmental engineering and construction field, which existed at the time and location of the work. No other warranty, either expressed or implied, has been made.

This investigation was prepared for the sole use and benefit of MidPen Housing Corporation. All reports, both verbal and written, whether in draft or final, are for the benefit of Seagate Properties, Inc. This report has no other purpose and may not be relied upon by any other person or entity without the written consent of AEI. Either verbally or in writing, third parties may come into possession of this report or all or part of the information generated as a result of this work. In the absence of a written agreement with AEI granting such rights, no third parties shall have rights of recourse or recovery whatsoever under any course of action against AEI, its officers, employees, vendors, successors or assigns. Reliance is provided in accordance with AEI's Proposal and Standard Terms & Conditions executed by MidPen Housing Corporation. The limitation of liability defined in the Terms and Conditions is the aggregate limit of AEI's liability to the client and all relying parties.

If there are any questions regarding our investigation, please do not hesitate to contact AEI at (408) 559-7600.

Sincerely,
AEI Consultants

APPENDIX B
LABORATORY ANALYTICAL REPORTS

McC Campbell Analytical, Inc.

"When Quality Counts"

Analytical Report

WorkOrder: 1512A77

Report Created for: AEI Consultants

3880 S. Bascom Ave, Suite 109
San Jose, CA 95124

Project Contact: Tim Bodkin

Project P.O.:

Project Name: 350428; Carlos & Sierra Streets, Moss Beach, CA

Project Received: 12/28/2015

Analytical Report reviewed & approved for release on 01/11/2016 by:

Angela Rydelius,
Laboratory Manager

The report shall not be reproduced except in full, without the written approval of the laboratory. The analytical results relate only to the items tested. Results reported conform to the most current NELAP standards, where applicable, unless otherwise stated in the case narrative.

Glossary of Terms & Qualifier Definitions

Client: AEI Consultants
Project: 350428; Carlos & Sierra Streets, Moss Beach, CA
WorkOrder: 1512A77

Glossary Abbreviation

95% Interval	95% Confident Interval
DF	Dilution Factor
DI WET	(DISTLC) Waste Extraction Test using DI water
DISS	Dissolved (direct analysis of 0.45 µm filtered and acidified water sample)
DLT	Dilution Test
DUP	Duplicate
EDL	Estimated Detection Limit
ITEF	International Toxicity Equivalence Factor
LCS	Laboratory Control Sample
MB	Method Blank
MB % Rec	% Recovery of Surrogate in Method Blank, if applicable
MDL	Method Detection Limit
ML	Minimum Level of Quantitation
MS	Matrix Spike
MSD	Matrix Spike Duplicate
N/A	Not Applicable
ND	Not detected at or above the indicated MDL or RL
NR	Data Not Reported due to matrix interference or insufficient sample amount.
PDS	Post Digestion Spike
PDSD	Post Digestion Spike Duplicate
PF	Prep Factor
RD	Relative Difference
RL	Reporting Limit (The RL is the lowest calibration standard in a multipoint calibration.)
RPD	Relative Percent Deviation
RRT	Relative Retention Time
SPK Val	Spike Value
SPKRef Val	Spike Reference Value
SPLP	Synthetic Precipitation Leachate Procedure
TCLP	Toxicity Characteristic Leachate Procedure
TEQ	Toxicity Equivalents
WET (STLC)	Waste Extraction Test (Soluble Threshold Limit Concentration)

Analytical Qualifiers

S	spike recovery outside accepted recovery limits
e2	diesel range compounds are significant; no recognizable pattern
e7	oil range compounds are significant

Glossary of Terms & Qualifier Definitions

Client: AEI Consultants
Project: 350428; Carlos & Sierra Streets, Moss Beach, CA
WorkOrder: 1512A77

Quality Control Qualifiers

F8 MS/MSD recovery and/or RPD was out of acceptance criteria; PDS validated the prep batch. If PDS recovery was out of acceptance criteria, DLT validated the prep batch.

NOTES: - STLC and TCLP extractions require 2 days to complete; therefore, all TATs begin after the extraction is completed (i.e., One-day TAT yields results in 3 days from sample submission).
 - MAI assumes that all material present in the provided sampling container is considered part of the sample - MAI does not exclude any material from the sample prior to sample preparation unless requested in writing by the client.

"When Quality Counts"

Analytical Report

WorkOrder: 1512A77 A

Report Created for: AEI Consultants

3880 S. Bascom Ave, Suite 109
San Jose, CA 95124

Project Contact: Tim Bodkin

Project P.O.:

Project Name: 350428; Carlos & Sierra Streets, Moss Beach, CA

Project Received: 12/28/2015

Analytical Report reviewed & approved for release on 01/15/2016 by:

Angela Rydelius,
Laboratory Manager

The report shall not be reproduced except in full, without the written approval of the laboratory. The analytical results relate only to the items tested. Results reported conform to the most current NELAP standards, where applicable, unless otherwise stated in the case narrative.

Glossary of Terms & Qualifier Definitions

Client: AEI Consultants
Project: 350428; Carlos & Sierra Streets, Moss Beach, CA
WorkOrder: 1512A77

Glossary Abbreviation

95% Interval	95% Confident Interval
DF	Dilution Factor
DI WET	(DISTLC) Waste Extraction Test using DI water
DISS	Dissolved (direct analysis of 0.45 µm filtered and acidified water sample)
DLT	Dilution Test
DUP	Duplicate
EDL	Estimated Detection Limit
ITEF	International Toxicity Equivalence Factor
LCS	Laboratory Control Sample
MB	Method Blank
MB % Rec	% Recovery of Surrogate in Method Blank, if applicable
MDL	Method Detection Limit
ML	Minimum Level of Quantitation
MS	Matrix Spike
MSD	Matrix Spike Duplicate
N/A	Not Applicable
ND	Not detected at or above the indicated MDL or RL
NR	Data Not Reported due to matrix interference or insufficient sample amount.
PDS	Post Digestion Spike
PDSD	Post Digestion Spike Duplicate
PF	Prep Factor
RD	Relative Difference
RL	Reporting Limit (The RL is the lowest calibration standard in a multipoint calibration.)
RPD	Relative Percent Deviation
RRT	Relative Retention Time
SPK Val	Spike Value
SPKRef Val	Spike Reference Value
SPLP	Synthetic Precipitation Leachate Procedure
TCLP	Toxicity Characteristic Leachate Procedure
TEQ	Toxicity Equivalents
WET (STLC)	Waste Extraction Test (Soluble Threshold Limit Concentration)

Analytical Qualifiers

S	spike recovery outside accepted recovery limits
e2	diesel range compounds are significant; no recognizable pattern
e7	oil range compounds are significant

Glossary of Terms & Qualifier Definitions

Client: AEI Consultants
Project: 350428; Carlos & Sierra Streets, Moss Beach, CA
WorkOrder: 1512A77

Quality Control Qualifiers

F8 MS/MSD recovery and/or RPD was out of acceptance criteria; PDS validated the prep batch. If PDS recovery was out of acceptance criteria, DLT validated the prep batch.

Client Contact: Tim Bodkin

Date Logged: 12/28/2015

Comments: TTLC Pb added to 024 & 043 1/14/16 1day TAT. TTLC Pb added 045, no charge since 043 was setup by mistake.

Contact's Email: tbodkin@aeiconsultants.com

Date Add-On: 1/15/2016

Lab ID	Client ID	Matrix	Test Name	Containers /Composites	Bottle & Preservative	Collection Date & Time	TAT	Sediment Content	Hold	SubOut
1512A77-045A	B-21-1.5	Soil	SW6010B (Lead)	1	Acetate Liner	12/22/2015 13:55	1 day		<input type="checkbox"/>	

NOTES: - STLC and TCLP extractions require 2 days to complete; therefore, all TATs begin after the extraction is completed (i.e., One-day TAT yields results in 3 days from sample submission).
 - MAI assumes that all material present in the provided sampling container is considered part of the sample - MAI does not exclude any material from the sample prior to sample preparation unless requested in writing by the client.
